

Blanchard River Watershed Study Mitigation Areas

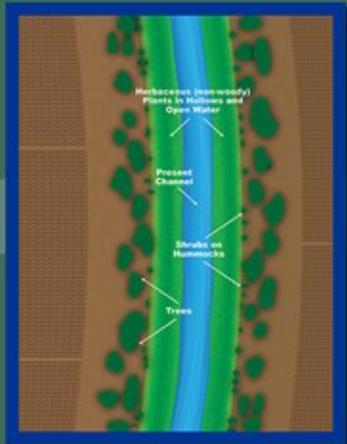

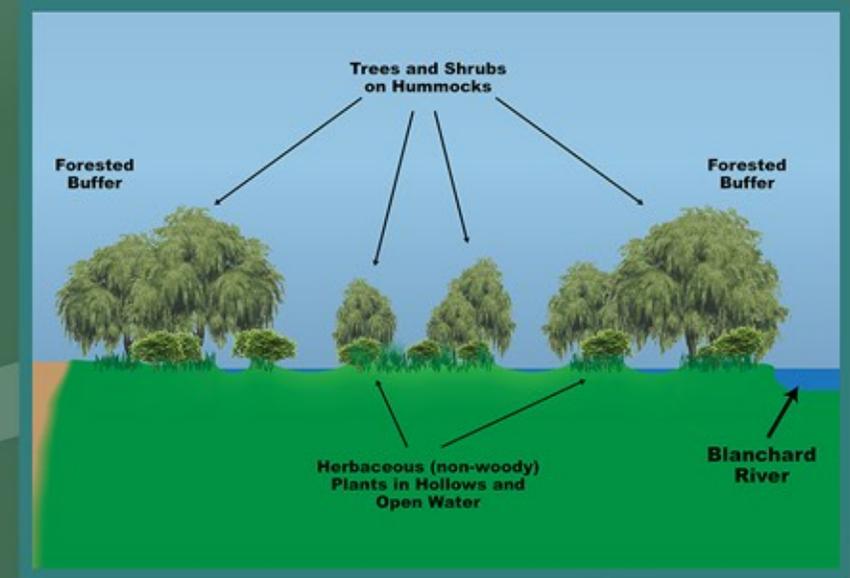

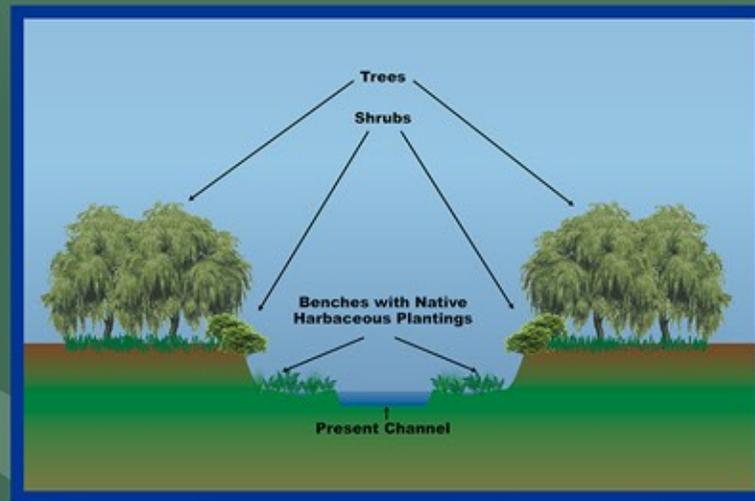

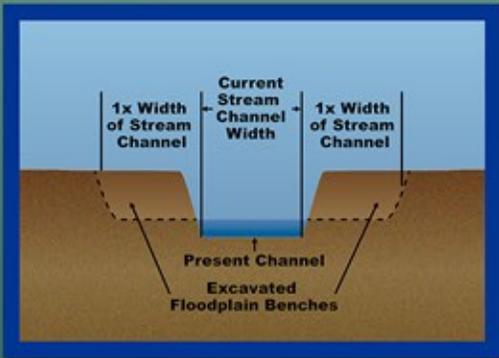

Stream mitigation

Stream mitigation would involve adding a flood plain bench to areas along Aurand Run and/or Lye Creek to create a two-stage channel with an associated forested/scrub-shrub buffer at the top of bank to improve fish and wildlife habitat. An Ecosystem Restoration Easement and/or Fee title* acquisition will be required.

Wetland mitigation

Wetland mitigation will include a mixture of forested/scrub-shrub and emergent wetlands in areas adjacent to the Blanchard River. Fee title* acquisition will be required.

*Fee title is full ownership of the property subject to any existing easements for public roads, highways, and public utilities.
