The Harshaw Chemical Company

The Harshaw Chemical Company is a 55-acre industrial facility located three miles south of downtown Cleveland. From 1944 to 1959, the Harshaw Chemical Company was under contract to the Manhattan Engineer District (MED) and the Atomic Energy Commission (AEC) to produce uranium for isotopic separation and enrichment in Oak Ridge, Tennessee.

In 2015, Building G-1, which was used to process uranium, was deconstructed, packaged, loaded, transported, and safely disposed of at a licensed disposal facility. Throughout deconstruction activities, radiological monitoring was conducted to ensure the protection of workers and the surrounding community. This project was safely completed for approximately $4 Million less than originally budgeted and four months ahead of schedule.

Braddock Bay

Braddock Bay is located in the Town of Greece, NY. This restoration project will restore a historic barrier beach that was once present and critical for maintaining the diverse ecological conditions within the bay. The scope of this project includes the following: a 1,700-foot long continuous rubble mound breakwater spine as a core for the beach; a 3-acre headland beach; and, two 150-foot long headland rubble mound breakwaters. The restoration of this barrier beach will allow the expansion of submerged and emergent wetland habitat while reducing the volume of sand and other sediments that are deposited within the bay. Construction of this project will commence in January 2016 so stay tuned for further updates.
